

Control Plan

Duration: 1 Day

Mode: Online / Classroom / On-Site

Certification: QLSS Certificate of Completion

Course Introduction

A Control Plan is a structured document used to describe the critical product and process characteristics and the associated controls required to ensure conformance to customer requirements. It forms the final output of the APQP process and serves as a bridge between process design and production.

This training provides comprehensive knowledge on preparing and maintaining Control Plans as per IATF 16949 and customer-specific requirements. Participants will understand how to link PFMEA, Process Flow Diagram (PFD), and Control Plan to ensure robust quality control at each step of manufacturing.

Pre-requisites

- Familiarity with manufacturing or assembly processes
- Basic understanding of PFMEA and process flow diagrams
- No prior Control Plan training required

Learning Objectives

- Understand the structure and purpose of a Control Plan
- Link PFMEA and Process Flow Diagram to the Control Plan
- Define control methods, reaction plans, and special characteristics
- Prepare control plans for prototype, pre-launch, and production stages
- Maintain traceability and ensure audit readiness
- Integrate Control Plan into production operations and quality assurance
- Use control plans for process improvement and problem-solving

Course Agenda

1. Introduction to Control Plans

- Definition and importance in quality systems
- Purpose and benefits of a well-maintained control plan
- Where it fits within APQP and PPAP

2. Types of Control Plans

- Prototype Control Plan
- Pre-launch Control Plan
- Production Control Plan
- Differences and evolution across stages

3. Key Components of a Control Plan

- Process step and product characteristics
- Control methods (measurement systems, frequencies)
- Reaction plans for non-conformance
- Special characteristics: identification and monitoring

4. Linkages to PFMEA and Process Flow

- Cross-functional preparation approach
- Ensuring 3-document alignment
- Driving control methods from severity and detection ratings

5. Maintaining and Updating Control Plans

- Audit triggers and change control
- Document control and versioning
- Real-time vs. static control plans

6. Control Plan and IATF 16949

- Clause-wise linkage with IATF 16949
- Integration with operational controls
- Customer-specific requirements (CSR) considerations

What You'll Receive

- QLSS Certificate of Completion
- Training Material / Handout (PDF Format)
- Final Assessment with Individual Evaluation Report

Who Should Attend

- Manufacturing and Quality Engineers
- APQP and NPI Teams
- Internal Auditors and Documentation Owners
- Supplier Quality and Project Teams
- Anyone responsible for product/process documentation

Trainer Profile

Our trainers are experienced APQP and manufacturing quality experts with hands-on knowledge of preparing, maintaining, and auditing control plans across sectors. With a strong grasp of customer requirements and IATF 16949 expectations, they guide participants to build practical, compliant, and audit-ready documentation.

Instructional Methodology

- Step-by-step walkthrough of templates
- Cross-reference exercises with PFMEA and PFD
- Case-based scenario building
- Group review of control plan documentation
- Hands-on audit simulation of control plan effectiveness

What Makes QLSS Control Plan Training Unique

- Template-driven, implementation-focused approach
- Practical linkages to FMEA and flow charts
- Emphasis on document control and version traceability
- Includes CSR considerations and auditor expectations
- Builds real-time application capability
